

Appendicular Skeleton and Disorders

Many diseases or disorders can affect the skeletal system. We will all look at gout and then choose another disorder from the list below. Create an interesting SLIDES presentation with all of the information below.

- Title the project APPENDICULAR SKELETON AND DISORDERS and type you name(s) below the title.
- How many bones can be found in the appendicular skeleton?
- Choose a type of break and describe how it could have happened.
- Name the types of joints found in your elbow and in your shoulder. How are they different?
- Describe what causes gout, where it usually hurts and possible ways to avoid another attack if you are prone to gout.
- Name a common medicine you can take and how it works. (Think of the funny commercial of the guy carrying a green jug on the subway)
- Include a picture of an X-ray from a person with rheumatoid arthritis.
